

Numerical Model Simulations of Nitrate Concentrations in Groundwater Using Various Nitrogen Input Scenarios, Mid-Snake Region, South-Central Idaho: Usgs Scientific Investigations Report 2012-5237 (Paperback)

Filesize: 7.01 MB

Reviews

This pdf is wonderful. It really is written in simple terms instead of hard to understand. It's been developed in an exceedingly simple way and it is just after I finished reading this ebook in which in fact modified me, altered the way in my opinion.

(Ollie Powlowski)

NUMERICAL MODEL SIMULATIONS OF NITRATE CONCENTRATIONS IN GROUNDWATER USING VARIOUS NITROGEN INPUT SCENARIOS, MID-SNAKE REGION, SOUTH-CENTRAL IDAHO: USGS SCIENTIFIC INVESTIGATIONS REPORT 2012-5237 (PAPERBACK)

Bibliogov, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.As part of the U.S. Geological Survey's National Water Quality Assessment (NAWQA) program nitrate transport in groundwater was modeled in the mid-Snake River region in south-central Idaho to project future concentrations of nitrate. Model simulation results indicated that nitrate concentrations would continue to increase over time, eventually exceeding the U.S. Environmental Protection Agency maximum contaminant level for drinking water of 10 milligrams per liter in some areas. A subregional groundwater model simulated the change of nitrate concentrations in groundwater over time in response to three nitrogen input scenarios: (1) nitrogen input fixed at 2008 levels; (2) nitrogen input increased from 2008 to 2028 using the same rate of increase as the average rate of increase during the previous 10 years (1998 through 2008); after 2028, nitrogen input is fixed at 2028 levels; and (3) nitrogen input related to agriculture completely halted, with only nitrogen input from precipitation remaining. Scenarios 1 and 2 project that nitrate concentrations in groundwater continue to increase from 10 to 50 years beyond the year nitrogen input is fixed, depending on the location in the model area. Projected nitrate concentrations in groundwater increase by as much as 2-4 milligrams per liter in many areas, with nitrate concentrations in some areas reaching 10 milligrams per liter. Scenario 3, although unrealistic, estimates how long (20-50 years) it would take nitrate in groundwater to return to background concentrations-the flushing time of the system. The amount of nitrate concentration increase cannot be explained solely by differences in nitrogen input; in fact, some areas with the highest amount of nitrogen input have the lowest increase in nitrate concentration. The geometry of the aquifer and the pattern of regional...
